SUMMARY

See where your farmers, food and agri-business processors are, communicate with them over mobile networks, efficiently organise support services, harvest, supply and market linkages.

ITC has designed a cloud-based database and suite of mapping, profiling and mobile communications applications to enable sustainable sector development and support services and to complement its trade, farm and business development tools.

Accessible from anywhere in the world, this suite of services and mobile applications around a database and mapping application allows Organisations* to profile, plot the location and geographic coordinates of the producers and processors they work with, listing their crops and qualifications and linking them with mobile telephone services. The results can be visualised on various mapping services such as Google Map and OpenStreetMap.

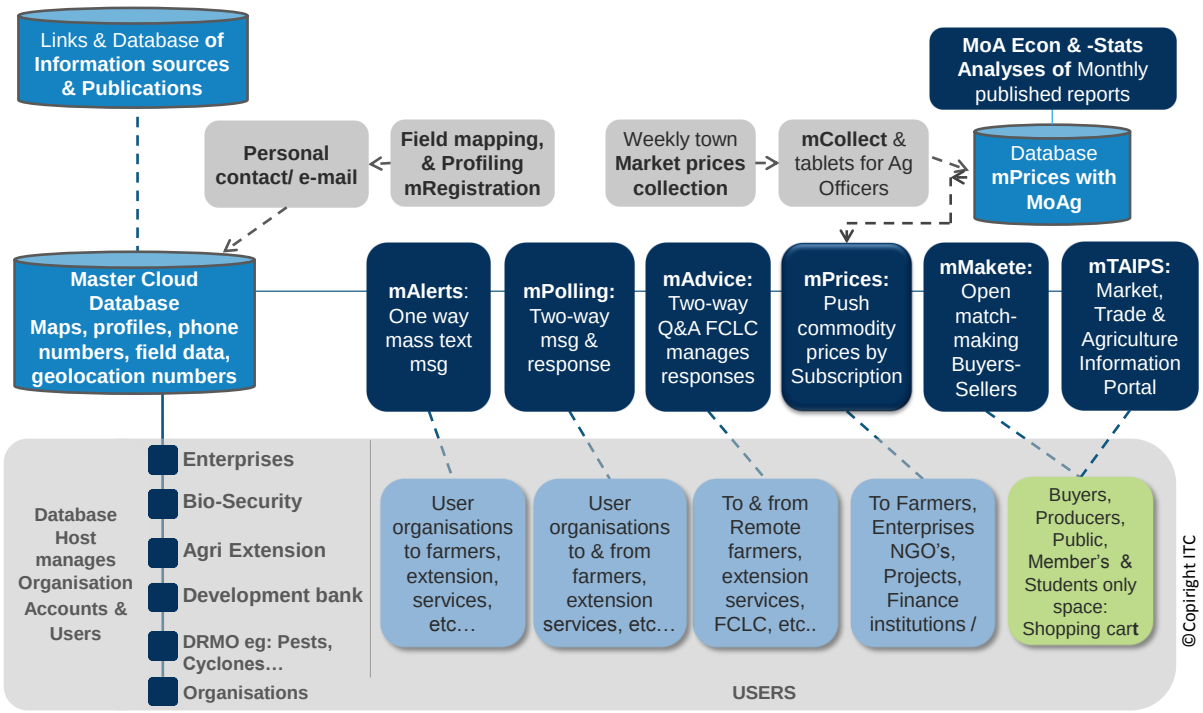

A flexible access control interface allows different users to have access to different levels of information and services such as: the public, organisation, farmer specific crop field data, and Administrator levels.

Main database and map applications

The database tools and services can be used for:

- Gender segregated mapping and profiling of:
  - Farmers / producers including skills, qualifications and certifications, types of crops, yields, farm and field sizes, etc;
  - Processing enterprises and exporters;
  - Farm, business and trade support services
- Aiding climate change preparations, disaster management planning and recovery pay-outs;
- Organising development financing, diaspora financing and project proposal reviews;
- Providing visual evidence for sustainability and corporate responsibility claims.

COVERAGE:	Database hosted by national organisations for use by stakeholders in sector development
TIME-FRAME:	Operational within months
BUDGET:	National set-up and adaptation plus fee annual fee
DEVELOPMENT GOALS:	Improving transparency and efficiency of sustainable development

Additional services

- Active filtering to select individuals or groups for linking with a suite of mobile applications , social media, e-mail, web interface and voice for tailored communications, such as:
  - One way mass text messaging - mAlerts
  - Two-way polling - mPolling
  - Farmer / Producer to User Organisation information requests and automatic FAQ building – mAdvice
  - Domestic market prices subscription service – mPrices
  - Access to trade and agriculture intelligence notifications – mTips
  - Access to a buyer-seller match-making tool / service – mMakete
  - Subscriptions and batch sms sales management for administrators
- Analysis & reporting through export of all data or selected filtered data;
- On request, anonymised comparisons with data sets from other parts of the world (subject to participating agencies authorisation.

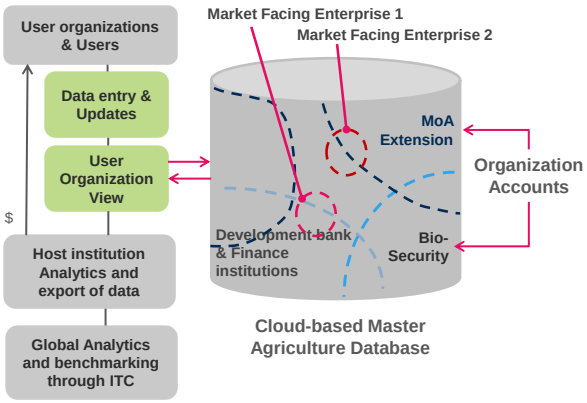

ITC or a national organisation can host the Master database on a secure cloud-based system. If the software is hosted by ITC then, along with its analysis services, ITC can provide periodic updates of the software to respond to changing users' needs. The Master database is provided with a customer relationship management (CRM) dashboard to facilitate initial data entry, day-to-day management of the system, data import/export, FAQ's, users and user subscriptions.

The database design minimises the effort required for maintaining up to date user information and mobile phone numbers through automating mobile phone system checks and by effectively delegating user data maintenance to User organisations that regularly interact with users and have a direct interest in data accuracy. The Master database manages duplicate and redundant data through a customer relationship management dashboard**.** Date can be input individually during visits to producers or imported from existing data sources. Field titles may be adapted for the style and language of the country of use.

The whole suite is easy to use and requires only a short period of adaptation and training. ITC can provide virtual or face-to-face training, a user guide and help desk service. A User organisation's Logo can be incorporated into the masthead of the screen.

Multiple users supported

The full suite of tools and services supports multiple concurrent users and User organisations. A schematic diagram of the databse and services is shown below:

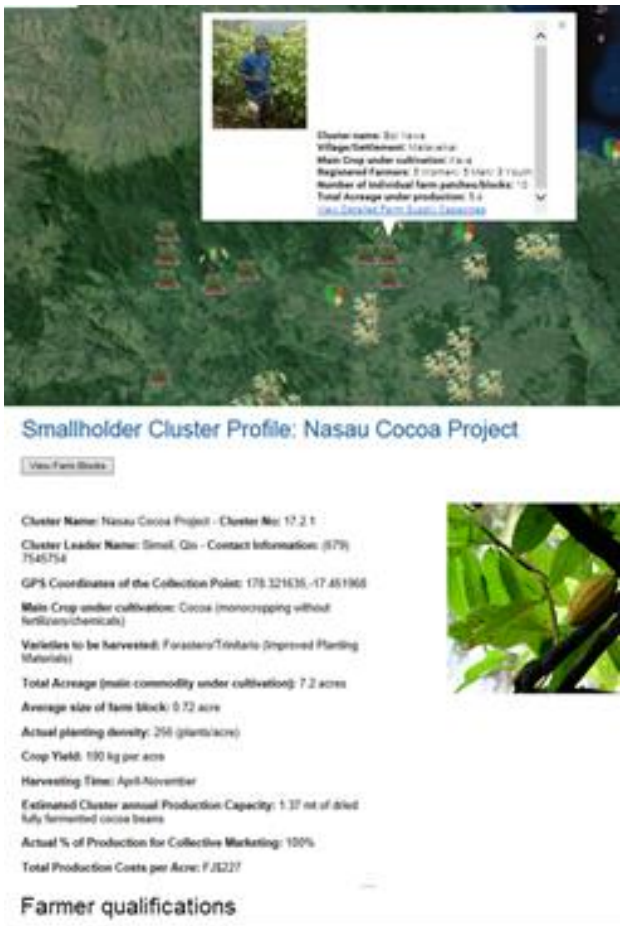

Database & Users schematic diagram ©ITCMay 2016

Resource requirements & business models

User organisations are required to pay a small set-up fee and an annual maintenance fee for ITC's hosting of the service, which is discounted if an organisation provides ITC and other users with either upgrades to the existing system or new tools that complement the database.

User organisations are free to charge fees for services provided through the User database. ITC provides User organisations with **example business models** to assist in operational cost recovery of services provided.

Example: Mapping and profiling of farmers and processors helps build frozen cassava and taro exports and sustainability claims

In Fiji's Ra Province more than 1,400 men and women farmers, who are beneficiaries of an EU-funded ITC project, have been mapped and profiled. 650 of them, farming cassava and taro, have been linked through equitable national processors to international retail and distribution networks in Australia and New Zealand. Retailers packaging can show, through links to their Internet sites, where the product insude the packet has been sourced from, the profiles and stories behind the communities and farmers that grew and conditioned the produce.

Audit of retailers sustainability claims is facilitated by the mapping, eliminating the audit cost on the farmer. Individual farmers can see their own farm, profiles and qualifications either when visiting an Internet café, through their children's school computer equipment or, if they have them, through their smartphones and home PC's. This provides motivation for farmers and also "Comfort" for buyers, development banks and financing institutions to be able to physically locate smalholder farmers in the supply chain, see their track record of skills development and certifications.

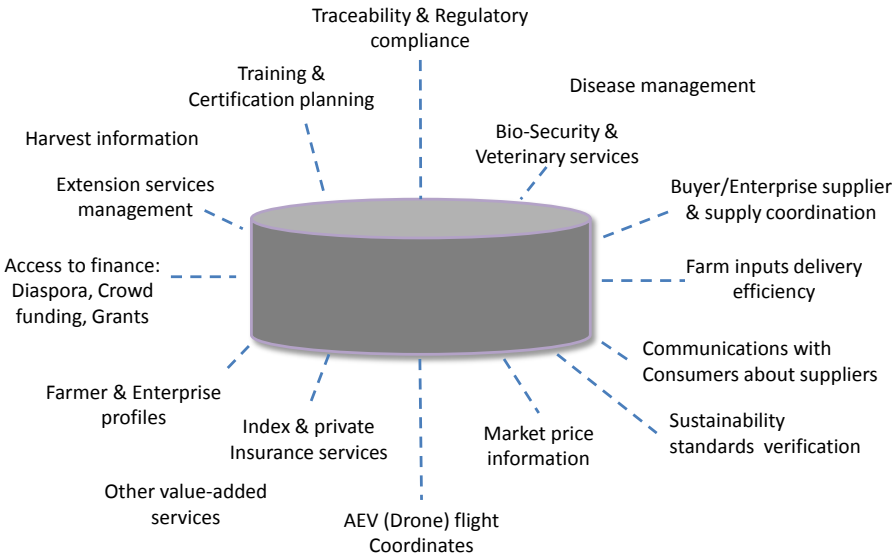

Each farmer and field can be linked with bio-security field level coding and a GS1 enterprise unique geolocation number for bio-security traceability and sustainability tracking purposes. Map visualisation improves planning efficiency and coordination of extension services, SPS, food safety, veterinary and health extension services and controls.

The end result: farmers are less isolated, better served, better linked and better off.

Farm cluster field maps, in Fiji's Ra Province

The geolocalisation & profiling database can provide a platform for extensive services to farmers, agri-food enterprises, rural communities, support and regulatory services.
